

We have added Watermark management on our latest version of SG DVR. This allows the user to apply a watermark on each camera input at the point of video recording, and provides the software to verify the integrity of any images exported.

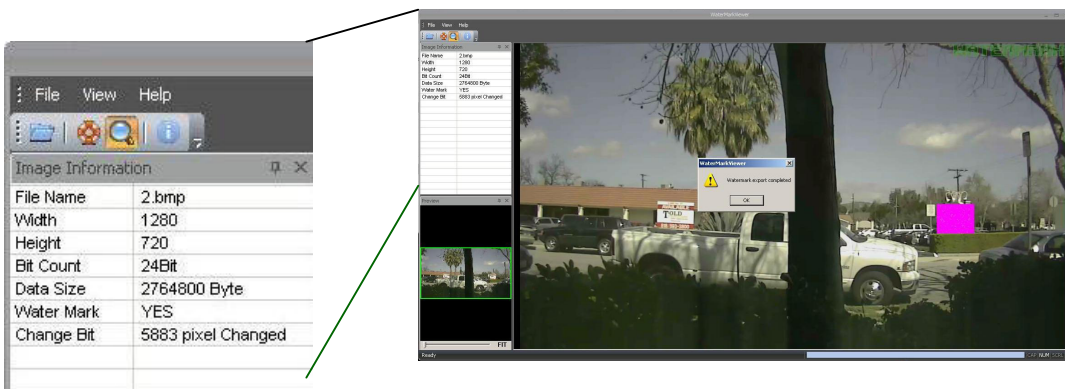

For any camera input where watermark is required, simply place a check mark in the Watermark box.

Now all video recorded on this channel will be encoded with a watermark and the word "watermark" will appear in the upper right corner of the image.

All video played back using our CMS or our Backup Viewer remains in our proprietary codec and keeps the watermark in place. When extracting a still image, the watermark is applied on export. The watermark checker application can then be used to verify any changed pixels and will accurately identify and display the area and actual quantity of changed pixels.

Altered image detected by our watermark checker.
